

Class Design - Constructor Overloading :

Question 1 :

To promote sales, a burger place provided discounts on the purchase of burgers. Define a class `Discounter` to calculate the total discount on a burger purchased using the following Data members and methods:

`int purchase` - To store the number of burgers that were purchased

`int discount` - To store the total discount on the purchase

`int cost` - To store the final cost of the purchase

`int orderNum` - To store the order number of the customer

`Discounter(int p, int o)` - Constructor to set the values for all variables

`void calculate()` - To calculate the total discount. Note that each burger costs ₹200 without any discount

Use the following table to calculate the discount:

Number of burgers	Discount per burger (in ₹)
1 burger	0
2 burgers	20
2 to 5 burgers	30
Above 5 burgers	100

`void display()` - To print the final cost and the order number.

Write a main method to create an object and call the above methods

Question 2 :

Define a class BookReview to store the details of a book. Use the following data members, and methods.

String name - To store the name of the book

int year - To store the year of publishing of the book

double rating - To store the overall rating of the book

String title - To classify the book as Legendary, Famous, known, less popular using the rating of the book

BookReview() - Default constructor to set default values for the instance variables.

BookReview(String s, int y, double r) - Constructor to initialise the values of the variables.

void calculateRating() - To find and display the title of the book based on the rating.

Use the following table to find a suitable title for the book:

Rating	Title
0 to 2.0	Less Popular
2.0 to 5.0	Known
5.0 to 8.0	Famous
8.0 to 10.0	Legendary

Create a main method to create an object of the class and call the methods
