

Conditional statements - Identify errors and rewrite the correct program :

Question 1 :

Teja was asked to write a program to check whether a student got more than 90 marks in a 100 marks exam and print true or false accordingly. He wrote the following program. Identify the errors and rewrite the correct program.

```
import java.util.*;
public class Exam{
    public static void main(String [ ] args){
        Scanner sc = new Scanner(System.in);
        System.out.println("enter the marks");
        int marks = sc.nextInt();
        if(marks < = 90) {
            System.out.println(true);
        }
    }
}
```

Question 2 :

A student was asked to write a program to calculate and display the area of a square. He wrote the following program. Identify the types of errors and rewrite the correct program

```
public class Area{
    public static void main(){
        int length, area;
        Scanner sa = new Scanner(System.in);
        System.out.println("enter the length of the side");
        length = sa.nextInt();
        System.out.println(area);
        area = length * length;
    }
}
```

Question 3 :

John was asked to write a program to take a number as input and find and display its cube root. Identify the type of error and rewrite the correct program:

```
public class Num{
    public static void main(String [ ] args){
        Scanner in = new Scanner(System.in);
        System.out.println("Enter the value");
        num = in.nextInt();
        System.out.println(Math.cbrt(num));
    }
}
```

Question 4 :

Krishna was asked to take two numbers, a and b, as input and find the quotient of the two numbers (a/b). Note that a and b are any values from 0 to 9 (0 and 9 included)

```
import java.util.*;
public class Values{
    public static void main(String [ ] args){
        int a,b;
        System.out.println("Enter two values");
        a = sa.nextInt(System.in);
        b = sa.nextInt(System.in);
        if(b ==0){
            System.out.println(a/b);
        }
        else {
            System.out.println("value not possible");
        }
    }
}
```
